Founder's Full-Stack Engineer | Product · AI · DevOps · Security

I turn a founder's idea into a **secure, tested, production-ready product, fast**, as one engineer instead of a hiring plan. In 2026 I shipped four products alone or with small teams: **3,700+ commits across 22 repositories**.

Open to equity, contract or full-time | Remote or relocation | Canadian PR, landing Nov/Dec 2026

Lower your build cost

One engineer across product, web, mobile, API and DevOps. No hand-offs between four hires, no agency overhead, and AI tooling that multiplies output without multiplying headcount.

Ship in weeks, not quarters

An iOS and Android app from empty scaffold to v1.2 in about three months. A full platform rebuild, API, seven web apps and smartwatch app, in about two months.

Secure and tested by default

Merge-blocking CI, secret scanning, dependency audits, encrypted sensitive data, 2FA for admins and 1,200+ automated test files. Speed never replaces review.

2026 IN NUMBERS

3,700+ commits I authored, Mar to Oct 2026

22 repositories: APIs, web, mobile, watch

4 founder products built end to end

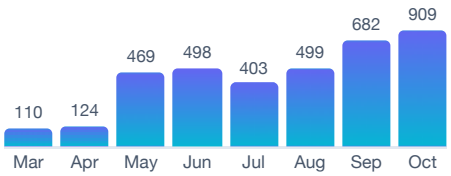

1,200+ automated test files across them

2 apps live on App Store and Google Play

PROFILE

Senior full-stack engineer with 8+ years in payments and SaaS, who works like a founding engineer: I own the problem, **write the spec, design the system, build it, deploy it and keep it running**. Years of hand-building fintech systems before AI tools taught me how to direct AI coding agents and, more importantly, how to review what they produce. My work runs on **real money rails**, Stripe, Paystack, Flutterwave, Square and bank APIs, where exactly-once correctness matters. I am happy to join early-stage teams for **equity** or a mix of equity and salary.

MY COMMITS PER MONTH, 2026

Output kept rising as I added products, with 199 active days since March.

HOW I WORK WITH FOUNDERS

1. **Scope** — Turn the idea into a short spec, a cut list and a release plan.
2. **Prototype** — Clickable Lovable or Figma AI screens to test the idea before building.
3. **Build with gates** — AI-assisted coding, with tests, PR review and security checks on every change.
4. **Deploy and run** — CI/CD, monitoring, over-the-air updates, then iterate on real feedback.

AI TOOLKIT: HOW I DELIVER FASTER AND BETTER

Claude Code: agentic coding with project rules, hooks and slash commands; reviewed and tested, never pasted blind.

Claude PR review in CI: automated review on every pull request, with secret scanning and release gates.

Lovable and Figma AI: clickable prototypes founders can react to before engineering time is spent.

Claude API: LLM features with schema-validated structured output, so malformed responses never reach users.

Plane AI + MCP: tasks linked to code, so every change traces back to a tracked piece of work.

Copilot, Amazon Q Developer, OpenCode, Gemini: pair-coding, code explanation and meeting notes.

1,350+ of my 2026 commits were co-written with Claude, and every one passed through tests, type checks and review before merging. AI sets the pace; I set the quality bar.

FULL-STACK, DEVOPS AND INTEGRATIONS, IN ONE PERSON

FRONT END	React · Next.js · React Native + Expo · TypeScript · Redux / Zustand · Tailwind · Nx monorepos
BACK END	Node.js · NestJS · Fastify · PostgreSQL · MongoDB · Prisma · Redis · RabbitMQ · Socket.IO
INTEGRATIONS	Stripe · Paystack · Flutterwave · Square POS · Zenith bank APIs · App Store + Play IAP · WhatsApp + SMS
DEVOPS	GitHub Actions CI/CD · Docker · Kubernetes · AWS · Azure · DigitalOcean · Render · EAS + OTA · Sentry
SECURITY + QA	Secret scanning · Dependency audits · RBAC + 2FA · Encryption at rest · Audit logs · Jest / Vitest · Playwright

EXPERIENCE

Independent Full-Stack Engineer and Product Lead (Contract)

Mar 2026 – Present

Embedded with four founder-led startups | Remote

- Built four products in parallel, owning product, front end, back end, DevOps and QA, with AI-assisted development inside enforced quality gates.
- Set up delivery guardrails across 22 repositories: CI on every pull request, Claude PR review, secret scanning, dependency audits, production release gates and task-linked work in Plane.
- Wrote specs, gap analyses and release plans, and used Lovable and Figma AI to prototype with founders before building.

TabCall Guest-to-staff service platform for bars and hotels (pre-launch) **513 commits · 6 repos**

- As sole developer, rebuilt a single Next.js app in about two months as a NestJS, Prisma and PostgreSQL API (60+ modules, 100+ data models), a 7-app Next.js monorepo and React Native apps for phones and smartwatches.
- Built Stripe checkout, subscriptions and webhooks, Square POS sync and Square Terminal, real-time staff queues over Socket.IO, and Claude-powered menu translation with schema-validated output.
- Enforced mobile test-coverage gates in CI (85% core logic, 70% components); 380+ test files; Sentry monitoring and venue-scoped audit logs.

EventFlutter Event ticketing and vendor marketplace Website App Store **2,000+ commits · 10 repos**

- Built and led the NestJS, MongoDB, RabbitMQ and Redis back end (260+ test files) with web, admin and mobile teams: Paystack and Flutterwave payments, plus exactly-once money movement for payouts, escrow and checkout over Zenith bank rails.
- Shipped offline QR ticket scanning with safe batch sync, 2FA admin sign-in, and security hardening (role escalation, input handling, CSRF, rate limits); ran a 10x scaling-readiness audit with a load-test gate.

Tax9ja Tax and compliance platform for employees, freelancers and SMEs **835 commits · 5 repos**

- Architected a Turborepo back end: NestJS and PostgreSQL modular monolith (20 domain modules), an API-key-secured public gateway and RabbitMQ workers; 350+ test files.
- Built a pure-function tax engine (PAYE, CIT, VAT, WHT) with versioned rules and property-based tests; encrypted BVN and NIN at rest and redacted identifiers from logs.

Jarakey Property management for tenants and managers Google Play App Store **361 commits**

- Took the iOS and Android app from empty scaffold to v1.2 in about three months: 82 screens, 90 components, 14 feature modules, Paystack billing and in-app purchases.
- Added merge-blocking type checks and tests (136 test files) after a type check surfaced 165 errors on the default branch; set up over-the-air preview and production release channels.

Senior Software Developer (Contract), SeedFi

Jun 2023 – May 2024

Digital lending platform, Nigeria | theseedfi.com | Google Play | App Store

- Architected and launched the lending platform that processes loan applications and quick cluster-loan disbursements.
- Cut production bugs by 30% and sped up releases with end-to-end acceptance tests and automated test frameworks.
- Set the component-library standards (React, Node.js, Tailwind CSS) used across the engineering team.

Earlier career

2018 – Oct 2026

Xpress Payments Limited, Senior Software Developer (Apr 2022 – Oct 2026): React, TypeScript and Node.js payment platforms for thousands of merchants; CI/CD on Docker and Kubernetes that cut deployment time by 40%. **Precise Financial Systems**, Software Engineer (2019 – 2020): payment reconciliation and batch tools. **Freelance** full-stack developer (2018 – 2024): dashboards and apps with Paystack and Flutterwave integrations.

SELECTED EARLIER PRODUCTS (FINTECH)

- **MyXpressPay**: merchant registration and payments for e-commerce, in-app and POS; now serving thousands of merchants.
- **PayXpress**: consumer app for airtime, bills, transfers and recurring payments; 300+ daily transactions.
- **Xpress Biller Service**: API-based B2B platform for partners to resell value-added services.
- **Echezona**: payment gateway for cards, bank transfers and USSD.

EDUCATION

Federal University of Technology, Akure
Nigeria | 2008 – 2014

CERTIFICATIONS

Microsoft Certified: Azure Fundamentals
Application Security and Secure Coding Training
Advanced React for Enterprise (Udemy)

Commit and repository counts come from each project's git history (2026); test counts from each codebase.
